

Enabling Azure keyVault unauthorized access monitoring

Wednesday, August 6, 2025 2:34 PM

To configure alerts for unauthorized access in Azure Key Vault, you'll need to set up monitoring and alerting using Azure Monitor, Log Analytics, and Action Groups. Here's a step-by-step guide based on internal documentation and Microsoft Learn resources:

❑ Required Settings and Enablement

1. Enable Diagnostic Logging

- Go to your Key Vault in the Azure portal.
- Navigate to Monitoring > Diagnostic settings.
- Enable logging for:
 - AuditEvent: Tracks access attempts and operations.
 - AllMetrics: Captures performance and usage data.
- Send logs to Log Analytics, Event Hub, or Storage Account for analysis

2. Configure Alerts via Azure Monitor

Use Azure Monitor to create alert rules based on metrics or logs:

Steps to Create Alerts

1. Go to Azure Monitor > Alerts > New Alert Rule.
2. Select your Key Vault as the resource.
3. Choose a signal type:
 - For unauthorized access, use Activity Logs or AuditEvent logs.
4. Define the condition:
 - Example: "Count of failed access attempts > 3 in 5 minutes."
5. Create an Action Group:
 - Add email, SMS, webhook, or ITSM integration (e.g., ServiceNow)
6. Set severity level and alert logic.
7. Save and enable the rule.

Recommended Alert Thresholds

Microsoft recommends configuring alerts for:

- Availability drops below 100%
- Unusual number of error codes
- Throttling events
- Firewall denials
- Access policy failures

Advanced Monitoring with Key Vault Insights

Enable Key Vault Insights for a unified dashboard showing:

- Request volume
- Latency
- Success/failure rates
- API usage patterns
